

Adopted Levels, Gammas

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh and Jun Chen		NDS 178,41 (2021).	12-Nov-2021

$Q(\beta^-) = -1674.62$  21;  $S(n) = 9657.46$  20;  $S(p) = 12536$  19;  $Q(\alpha) = -8111$  3    [2021Wa16](#)

$S(2n) = 16495.23$  21,  $S(2p) = 22798.9$  28 ([2021Wa16](#)).

Mass measurements: [2007Gu09](#), [2005Gu36](#), [2004He32](#), [1974De22](#).

Following reactions deal with cross sections or reaction mechanism:

$^{66}\text{Zn}(^{14}\text{C}, ^{16}\text{O})$ : [1981Be40](#) (72 MeV).

$^{65}\text{Cu}(n, d)$ ,  $(n, np)$ : [1987Ah01](#) (9, 11 MeV), [1982Sh28](#) and [1979Sh25](#) (14.2 MeV), [1979Gr06](#) (14.8 MeV), [1967Ch02](#) (14 MeV), [1965Fa06](#) (14 MeV).

Additional information 1.

$^{65}\text{Cu}(\gamma, p)$ : [1971We06](#) (17 MeV), [1968Ab10](#) ( $\leq 26$  MeV).

$^{65}\text{Cu}(p, 2p)$ : [1977Sh03](#) and [1977ShZQ](#) (17 MeV).

$^{64}\text{Ni}(d, np)$ : [1971Ne07](#) and [1970Ne16](#) (13.6 MeV), [1968Cu04](#) ( $< 16$  MeV).

$^{64}\text{Ni}(\pi, X\gamma)$   $E = 100, 160, 220$  MeV: [1978Ja19](#). Measured prompt and  $\beta$  delayed spectra of residual nuclides.

$^{64}\text{Ni}(\pi^-, \gamma)$ : [1990Ku08](#).

Muonic atom: [1976Sh21](#).

Antiprotonic atom: [2001Tr23](#).

$^{64}\text{Ni}(\pi, X)$ : mesic atom: [1990Ku08](#).

$^{64}\text{Ni}(t, t)$   $E = 20$  MeV: [1969FI06](#): Measured  $\sigma(\theta)$ .

$^{64}\text{Ni}(a, dd)$ : [1988Me14](#) (96 MeV).

$^{65}\text{Cu}(n, d)$   $E = 6-16$  MeV: [1997Di07](#): analysis of  $\sigma(E)$  data.

$^{62}\text{Ni}(^{18}\text{O}, ^{16}\text{O})$ : [1973Au02](#) (50, 57, 65 MeV).

Hyperfine structure, isotope shift measurement with optical method: [1980St21](#).

Consult NSR database for theory references on nuclear structure.

$^{64}\text{Zn}$  can decay by double  $\beta$  decay to  $^{64}\text{Ni}$ . Many measurements have been reported dealing with search for  $\beta$  transition to  $^{64}\text{Ni}$  g.s.. No definitive decay has been observed, upper limits on  $^{64}\text{Zn}$  half-life have been established. The latest reports are [2020Az05](#), [2011Be39](#), [2010Be41](#), [2009Be27](#), [2009Da16](#), [2008Be02](#), [2007Bl15](#), [2006Wi12](#), [2006Zu02](#). For details, see T<sub>1/2</sub> comment for g.s. of  $^{64}\text{Zn}$  in Adopted Levels for  $^{64}\text{Zn}$ .

13.2×10 <sup>3</sup> 3	4.8 MeV 3	I	E(level),T <sub>1/2</sub> : energy and width for a giant quadrupole resonance ( <a href="#">1974Gu16</a> ).
15.4×10 <sup>3</sup> 2	4.2 MeV 2	T	E(level),T <sub>1/2</sub> : energy and width for a giant quadrupole resonance ( <a href="#">1990Ga07</a> ).
15.60×10 <sup>3</sup> 30	5.64 MeV 40	R	E(level),T <sub>1/2</sub> : energy and width for a giant quadrupole resonance ( <a href="#">1992Yo01</a> ).
16.4×10 <sup>3</sup> 10	6.8 MeV 1	J	E(level),T <sub>1/2</sub> : energy and width for a giant quadrupole resonance ( <a href="#">1989Oa01</a> ).

<sup>†</sup> From a least-squares fit to  $\gamma$ -ray energies with uncertainties for levels connected with those  $\gamma$  transitions and from reaction data for others, unless otherwise noted. Above  $\approx 4$  MeV, due to high level density and limited resolution the correspondence of levels from different reactions is somewhat ambiguous.

<sup>‡</sup> Above 3.5 MeV, due to high level density L-transfer values available from only one reaction such as (t, $\alpha$ ) or (d, $^3\text{He}$ ) are considered tentative for  $J^\pi$  assignments.

<sup>#</sup> From [2020Ma37](#) in (n, $\gamma$ ) E=th. The authors state that the decay pattern is only consistent with 0<sup>+</sup> based on an unpublished (n, $\gamma$ ) E=th experiment at ILL and that  $\gamma\gamma(\theta)$  of a cascade toward 1346 level also yields firm 0<sup>+</sup> assignment.

<sup>†</sup> From <sup>238</sup>U(<sup>64</sup>Ni, <sup>64</sup>Ni'γ), unless otherwise noted.

<sup>‡</sup> From (n,γ) E=th.

<sup>#</sup> γ from (p,p'γ) only, shown in the level scheme by 1969Be20, where the measured γ-ray energies were not listed. The energy here is deduced from level-energy difference. This value is considered as approximate and may deviate by as much as 15 keV from that quoted in (p,p'γ) dataset.

@ 2020Ma37 in (n,γ) E=th states that γγ(θ) of the cascade toward 1346 level indicates a dominant M1 character, with only a small E2 admixture.

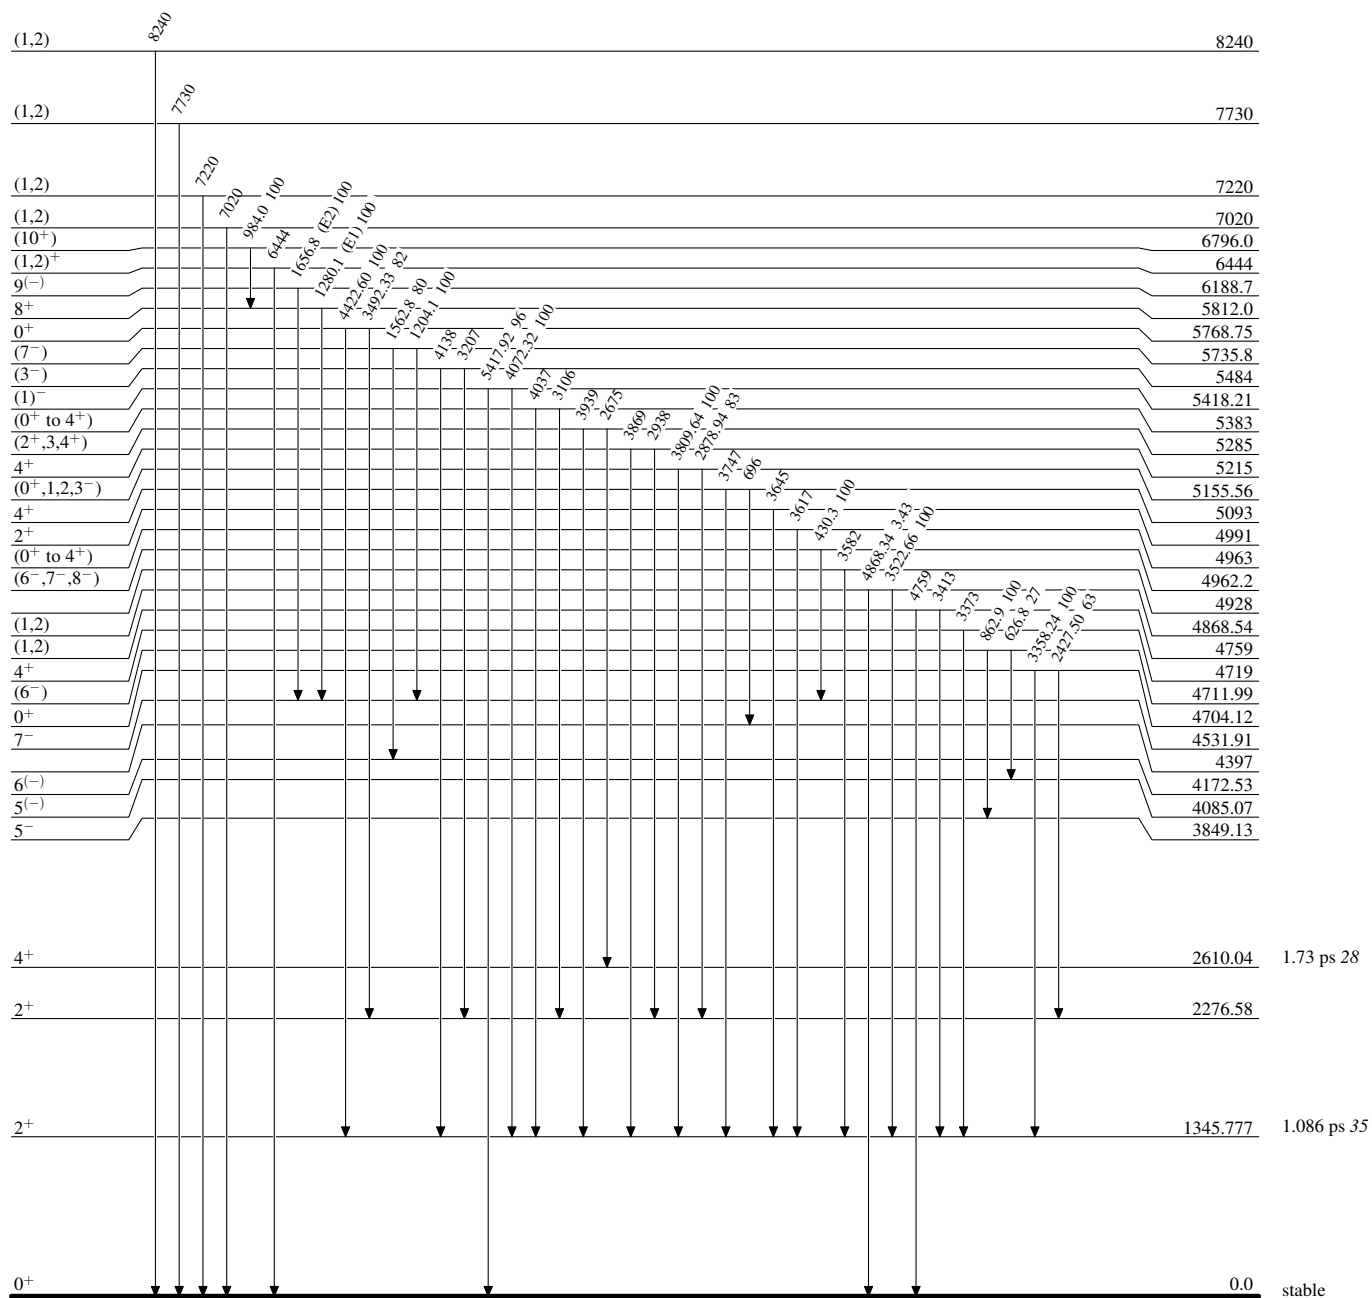

& Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ-ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

<sup>a</sup> Placement of transition in the level scheme is uncertain.
