

Adopted Levels, Gammas

| Type | Author | History | Citation | Literature Cutoff Date |
|-----------------|------------------------------------------------|---------|--------------------|------------------------|
| Full Evaluation | Alan L. Nichols, Balraj Singh, Jagdish K. Tuli | | NDS 113,973 (2012) | 15-Apr-2012 |

$Q(\beta^-) = -3958.9$ 5; $S(n) = 10595.9$ 4; $S(p) = 11137.2$ 8; $Q(\alpha) = -7016.3$ 5 [2012Wa38](#)

Note: Current evaluation has used the following Q record -3958.90 4810595.8 3 11137.2 7 -7016.3 4 [2011AuZZ](#).

$S(2n) = 18415.95$ 31, $S(2p) = 19910.9$ 34 ([2011AuZZ](#)).

Values in [2003Au03](#): $Q(\beta^-) = -3948$ 4, $S(n) = 10596.5$ 3, $S(p) = 11136.6$ 7, $Q(\alpha) = 7017.6$ 6, $S(2n) = 18416.7$ 3, $S(2p) = 19912$ 3.

[2001Tr23](#): measured level widths and shifts in anti-protonic atoms.

[2006An27](#): nuclear structure calculations of first 2^+ and 3^- states.

Other Reactions:

$^{63}\text{Cu}(\gamma, p)$: [1975We11](#), [1971We06](#), [1968Ab10](#); g.s. and first 2^+ levels.

$^{65}\text{Zn}(n, \alpha)$: [1984Em01](#): E=thermal, FWHM=50-60 keV, measured $\sigma(\theta)$ for g.s. and first 2^+ level.

$^{66}\text{Zn}(d, ^6\text{Li})$: [1973Ce02](#): E=27.25 MeV, Si telescopes, FWHM=400 keV, $\sigma(\theta)$ for g.s. and first 2^+ state.

XREF table: the following levels are populated in reactions labeled with XREF=Y:

$^{58}\text{Fe}(^{16}\text{O}, ^{12}\text{C})$: 0, 1173, 2340, 2890, 3270, 3520, 3750.

$^{62}\text{Ni}(^3\text{He}, ^3\text{He}'), (^3\text{He}, dp)$: 0, 1173, 2300, 2340, 3750, 4350.

$^{63}\text{Cu}(n, n\gamma)$: 0, 1173, 2302, 2336, 3059.

$^{63}\text{Cu}(^6\text{Li}, ^7\text{Be}), (^9\text{Be}, ^{10}\text{B})$: 0, 1173.

$^{64}\text{Zn}(^{14}\text{C}, ^{16}\text{O})$: 0, 1173.

$^{66}\text{Zn}(\alpha, 2\alpha)$: 0, 1173, 2360.

^{62}Ni isotope identified in mass spectroscopic data by F.W. Aston, Nature 134, 178 (1934).

 ^{62}Ni Levels

$T_{1/2}$ (first 2^+ level at 1173 keV):

$\tau = 2.09$ ps δ is weighted average of 13 values from different methods listed as comments below. A minimum uncertainty of 5% was assigned, and three methods were employed in the weighted averaging procedures. A value consistent with all the three methods has been adopted (LWM: limitation of statistical weights; NRM: normalized residuals method; RT: Rajeval technique). Reduced χ^2 varies between 1.1 and 2.2 in the three methods. [2001Ra27](#) evaluation adopted a very similar value of $\tau = 2.07$ ps δ which did not include the [2001Ke08](#) measurement. Other: $T_{1/2} = 1.24$ ps $+60-33$ ([2011Ch05](#)) in $(n, n'\gamma)$.

Individual values of mean lifetime τ in ps as used in the averaging procedures are given below:

1. Deduced from BE2 \uparrow measurement in Coulomb excitation: 2.25 45 ([1960An07](#), earlier value of 1.40 35 in [1959Al95](#)), 2.23 22 ([1962St02](#)), 2.20 13 ([1969Ha31](#)), 2.05 6 ([1970Le17](#)), 2.09 7 ([1971ChZF](#)).
2. From Γ in (γ, γ') : 2.15 42 ([1981Ca10](#), also 2.1 ps 5 in [1977Ca14](#) from the same group as [1981Ca10](#)).
3. From B(E2) in (e, e') : 2.096 27 ([1967Du07](#)), 2.99 20 ([1972Li28](#)), 1.82 18 ([1975DeXW](#)).
4. From DSAM in $(\alpha, p\gamma)$: 1.55 25 ([1978Ke11](#)), 1.6 $+4-6$ ([1978Oh04](#)).
5. From DSAM in Coulomb excitation: 2.28 18 ([1965Es01](#)), 2.01 12 ([2001Ke08](#)), uncertainty increased to 0.12 to include 5% systematic uncertainty due to stopping powers, as suggested by one of the authors of [2001Ke08](#) in an e-mail communication to evaluators, December 2007.

[†] Level energies given with decimals are from a least-squares fit to the adopted E_γ data. Others are from $^{64}\text{Ni}(\text{p},\text{t})$ and $^{62}\text{Ni}(\text{p},\text{p}')$, and from $^{61}\text{Ni}(\text{d},\text{p})$ at the highest energies.

[‡] Parity same as that of 4160 level, from $^{48}\text{Ca}(^{18}\text{O},4\text{n}\gamma)$.

From $^{61}\text{Ni}(\text{n},\gamma)$: $J^\pi=0^+$ to 3^+ from primary E1 transition from $1^-,2^-$ capturing state, γ to 0^+ excludes 0 and 3.

@ From $^{61}\text{Ni}(\text{n},\gamma)$: $J^\pi=0^+$ to 3^+ from primary E1 transition from $1^-,2^-$ capturing state, γ to 4^+ excludes 0 and 1.

& From $^{48}\text{Ca}(^{18}\text{O},4\text{n}\gamma)$, except as noted.

^a From DSAM in $^{59}\text{Co}(\alpha,\text{p}\gamma)$.

^b From DSAM in $^{62}\text{Ni}(\text{n},\text{n}'\gamma)$.

^c Neutron resonance, J^π from R-matrix analysis (2006Ko28).

[†] [Additional information 1.](#)[‡] From $(n, n'\gamma)$ for $E(\text{level})$ up to 3756.4; for others E_γ are averages from the most precise measurements. The most complete data from $^{61}\text{Ni}(n, \gamma)$ tend to have E_γ that are 0.1-0.2 keV lower than other data in the range where comparisons are possible (1-3 MeV).[#] Primarily based on (n, γ) data.[@] From $(n, n'\gamma)$ or (n, γ) , except as noted.

Adopted Levels, Gammas (continued)

$\gamma(^{62}\text{Ni})$ (continued)

& From RUL and $\gamma(\theta)$ in $^{48}\text{Ca}(^{18}\text{O},4n\gamma)$.
a From $\gamma(\theta)$ in $^{48}\text{Ca}(^{18}\text{O},4n\gamma)$.
b Mult=D+Q from $\gamma(\theta)$. $\Delta\pi$ =no from level scheme.
c Mult=Q from $\gamma(\theta)$. $\Delta\pi$ =no from level scheme.
d Placement of transition in the level scheme is uncertain.
