Adopted Levels, Gammas

History

Type	Author	Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh and Jun Chen	NDS 178, 41 (2021).	12-Nov-2021

Q(β^-)=−7171.2 *15*; S(n)=11861.9 *15*; S(p)=7713.1 *6*; Q(α)=−3955.7 *7* 2021Wa16
Q(2ε)=1095.0 *7*, S(2n)=20978.6 *8*, S(2p)=13835.5 *6* (2021Wa16).
Mass excess measurements: 2018Ki21, 2008Go23, 2007Ke09, 2005Ch60, 1977De20, 1976De21.
Other reactions:
^{59}Co(^{6}Li,n) E=39.7, 90 MeV: 1984Bo45: Measured $\sigma(\theta)$, reaction mechanism.
^{60}Ni(α,p):IAR E=7.260-7.450 MeV: 1976Fo06: Measured resonance strengths. Other: 1961No04.
^{60}Ni(α,α'):IAR E=14.6-20.9 MeV: 1975Lu06: Si telescope, $\sigma(\theta)$, deduced isospin mixing for ^{64}Zn at excitations of 17.6-23.5 MeV.
^{61}Ni(α,n) E=53 MeV: 1984Bo45, 1979Bo45: $\sigma(\theta)$, reaction mechanism.
Additional information 1.
^{64}Zn(t,t) E=12 MeV: 1972Hu06: measured $\sigma(\theta)$. Deduced optical model-parameters.
^{64}Zn(^{6}Li,^{6}Li), (^{7}Li,^{7}Li): 1991Bo48.
^{27}Al(^{37}Cl,X) and ^{48}Ti(^{16}O,X): 1984Mi09 (scission mechanism for excited ^{64}Zn nucleus).
^{63}Cu(^{16}O,^{15}N): 1975We20 E=38-51 MeV. Reaction mechanism.
^{60}Ni(^{18}O,^{14}C): 1973RoYT, 1972HeYV.
^{64}Zn(π^+,π^-): 1993Be02: E=293.4 MeV, measured $\sigma(\theta)$.
^{64}Zn(π^+,π^-): 1997Fo03: E=140-230 MeV, measured $\sigma(\theta)$.
^{64}Zn(K$^-$,X): 1980De11, calculated atomic level shifts.
^{64}Zn(^{7}Li,tα) E=42 MeV: 2001To07 (also 1999Ut03): measured triton and α spectra, $\sigma(\theta)$, deduced astrophysical S factors.
^{64}Zn(^{10}Be,^{10}Be),((^{11}Be,^{11}Be),E(c.m.)=24.5 MeV: 2014DiZV: measured $\sigma(\theta)$ for elastic scattering at REX-ISOLDE facility of CERN, and analyzed using CDCC with optical model calculations.
Giant-dipole resonances: 1981Do12 (^{64}Zn(e,p)); 1977TaYW (^{64}Zn(γ,α)); 1973Ya04 (^{64}Zn(γ,n), (γ,np)); 1972ClZK (^{64}Zn(γ,p)); 1970Co25 (^{64}Zn(γ,n), (γ,2n), (γ,np)).
Isotope shifts: 1970Le23. Theory: 1982Fo09.
There are several high-spin studies: ^{12}C(^{54}Fe,2pγ) from 1994Cr05; ^{40}Ca(^{28}Si,4pγ) E=115 MeV from 1998Ga11; ^{40}Ca(^{28}Si,4pγ) E=120 MeV from 1997Fu08; ^{40}Ca(^{28}Si,4pγ) E=122 MeV from 2004Ka18; ^{51}V(^{16}O,p2nγ),^{59}Co(^{7}Li,2nγ) from 1977We10, 1978We15, and 1977Al14; ^{61}Ni(α,nγ),^{56}Fe(^{11}B,2npγ) from 1980Si02 and 1978Si02; ^{61}Ni(α,nγ),(HI,xnγ) from 1978Ne02 and 1976Ch11. While there is general agreement between all these studies below about 5 MeV excitation, above this energy, there are major differences even when the same reaction is used as in 2004Ka18, 1998Ga11 and 1997Fu08. Since the statistics in $\gamma\gamma$ coincidences is the highest in 2004Ka18, where Gammasphere array has been used, evaluators have adopted the high-spin level scheme from 2004Ka18 with the exception of few cases where results of 2004Ka18 are in clear disagreement with other experiments, the results of which are considered by evaluators as more definitive. Such cases are noted in comments. It should also be mentioned that complete details of data are not available from 2004Ka18. Requests by evaluators for obtaining such details from the authors of 2004Ka18 were unsuccessful. Full details of data are also missing in 1998Ga11 and 1997Fu08, although, some were obtained as priv. comm. (1996GaZZ) from authors of 1998Ga11. Several levels proposed by 1998Ga11, 1997Fu08 and 1994Cr05, but not reported by 2004Ka18 have been omitted here. See individual datasets for details.
In the opinion of the evaluators, there are several incomplete or discrepant aspects of the high-spin portion of the level scheme which need to be resolved in further experiments.

0.0[&]	0^+	stable[@]	ABCDEFGHIJKLMNOPQRST VWXYZ	XREF: Others: AB, AC, AD, AE, AF, AG, AH, AI, AJ, AK Evaluated rms charge radius $<r^2>^{1/2}$=3.9283 fm *15* (2013An02). Evaluated $\delta<r^2>(^{66}Zn,^{64}Zn)$=−0.162 fm^2 *2* (2013An02). Measured change in isotope shift $\delta\nu(^{68}Zn,^{64}Zn)$=−141.2 MHz *12*(stat) *66*(syst) (2019Xi07, collinear laser spectroscopy at ISOLDE, CERN), with laser wavelength of 480.7254 nm to match the Doppler shifted transition. Measured change in charge radius $\delta<r^2>(^{68}Zn,^{64}Zn)$=−0.279 fm^2 *4*(stat) *34*(syst) (2019Xi07, collinear laser spectroscopy at ISOLDE, CERN), with laser wavelength of 480.7254 nm to match the Doppler shifted transition. J^{π}: hyperfine structure measurements: 1929Sc01, 1931Mu02. $T_{1/2}$: see footnote for lower limits for double β decay. Additional information 2.
991.54[&] *5*	2^+	1.94 ps *5*	BCDEFGHIJKLMNOPQRST VWXYZ	XREF: Others: AB, AC, AD, AE, AF, AG, AH, AI, AJ, AK β_2=0.260 *18* (1987Ja04) μ=+0.89 *14* (2005Le12,2010Mo14,2020StZV) Q=−0.143 *21* (1976Ne06,1977Ne05,1981Ko06,2016St14, 2021StZZ) XREF: J(960)N(1024)AB(920). Additional information 3. E(level): level energy held fixed in least-squares adjustment. J^{π}: E2 γ to 0^+. β_2: from (p,p'). Others: see (e,e'); (n,n'); (p,p'); (d,d'); (^{3}He,^{3}He') and (α,α'). β_2(pol p,p')=0.26, 0.25 (1993Mo15). Negative sign is indicated by 1991Ku30 from an analysis of $\sigma(\theta)(\alpha,\alpha')$ data. μ: from transient fields in Coul. ex. (2005Le12,2010Mo14). Others: +0.89 *9* (2002Ke02), +0.92 *20* (1979Fa06), +0.84 *18*, +1.04 *24* (1978BeZJ,1979BrZP). 2010Mo14 reanalyzed their previously measured g factor of +0.45 *3* in 2005Le12 using a different procedure for precession effect, and obtained the same value. Uncertainty of 0.06 in 2010Mo14 increased to 0.14 in 2020StZV evaluation. Q: from electron scattering (1976Ne06,1977Ne05, value of −0.124 *11* reanalyzed by 1981Ko06 to −0.143 *21*. Others: −0.32 *6* or −0.26 *6* (1988Sa32, reorientation method in Coulomb excitation; −0.135 *14* ((e,e'), 1972Li12); −0.01 *+9−5* (Coul. ex., 2003KoZQ). $T_{1/2}$: weighted average of 1.97 ps *6* (DSA in Coul. Ex.,2005Le12); 1.87 ps *6* (DSA in Coul. Ex.,2002Ke02); 2.06 ps *17* ((γ,γ'),1981Ca10); 2.8 ps *7* (RDDS in (^{16}O,p2nγ),1977Al14); 1.71 ps *21* (line shape in Coul. ex., 1973Fi15) and 2.16 ps *15* ((γ,γ'),1971ImZY). Values deduced from B(E2) values in Coul. Ex. and (e,e') are somewhat lower: 1.76 ps *4* (from B(E2)=0.168 *4*,1988Sa32); 1.82 ps *10* (from B(E2)=0.162 *9* and 1.83 ps *13* from B(E2)=0.161 *12*,1975Th01); 1.73 ps *15* (from B(E2)=0.170 *15*, 1962St02). Weighted average of all the values is 1.84 ps 4. 2001Ra27 evaluation quotes 1.86 ps 17 from weighted average of 15 values (B(E2) in Coul. Ex.: 1988Sa32,1975Th01,1962St02,1960An07, 1956Te26; Doppler-shift method in Coul. Ex.: 1973Fi15; Doppler-shift

† From a least-squares fit to Eγ data for levels populated in γ-ray studies, assuming ΔEγ=3 keV for high-energy γ rays from proton capture and resonance states. Normalized χ^2=0.92. Energies of levels populated only in particle-transfer reactions are primarily from (p,p′). Due to high level density and limited resolution, correspondence of levels, above ≈3.5 MeV excitation, from different reactions is somewhat ambiguous.

‡ In cases where L(p,p′) is used, parity is $(-1)^L$ and spin is L for levels up to 3.2 MeV, with the possibility of L-1, L, L+1 for higher levels, although J=L is the most likely choice, which is listed first, followed by less likely J=L−1 and J=L−2. For levels above ≈5 MeV populated in in-beam high-spin studies, J^π values are based on γ(θ), γγ(θ) (DCO), band associations, and assumption of ascending spins with excitation energy.

Mainly from DSA method in (α,nγ),(^{11}B,2npγ) (also (α,nγ) and (n,n′γ)). Values quoted from 1977Al14 are from recoil distance method (RDDS) in (^{11}B,2npγ). Above 3458 values are available from (^{11}B,2npγ) only. For some of the levels, values from different studies are in disagreement and are noted under comments.

@ Double β decay to ^{64}Ni is possible with Q value=1095.7 7. From measurements of double β decay, lower limits of half-life for decay to ^{64}Ni g.s. have been determined (generally at 90% confidence level): $T_{1/2}(2\nu2K)$: ≥1.1×10^{19} y (2011Be39, also 2010Be41, 2009Be27, 2008Be02); $T_{1/2}(\varepsilon\beta^+)$: ≥1.1×10^{18} y (2009Da16), ≥1.3×10^{20} y (2007Ki13); $T_{1/2}(2\varepsilon)$: ≥3.3×10^{17} y

† When a level is populated in two or more datasets, averages of values are taken where uncertainties are given. Additional comments are also provided for certain individual γ rays.

‡ From $\gamma(\theta)$ and/or γ(lin pol) in (α,nγ),(^{11}B,2npγ). (1980Si02,1978Si02). RUL (for E2 and M2) also used when $T_{1/2}$ known. Mult=Q (most likely E2) from ΔJ=2, quadrupole transition; mult=D or D+Q for ΔJ=1 (or in rare cases ΔJ=0), dipole or dipole+quadrupole transition. For some of the transitions, especially, for high-spin (J≥4) levels, multipolarities are also established in ^{51}V(^{16}O,p2nγ),^{59}Co(^{7}Li,2nγ) from $\gamma(\theta)$, γ(pol) and level lifetimes.

Ordering of 1314-1046-1583 cascade above the 4636, 7^- level is from (^{28}Si,4pγ) (2004Ka18 and 1997Fu08). Others: 1046-1314-1583 cascade in 1998Ga11, 1047-1582 cascade in 1994Cr05 with no 1314γ reported, only the 1046γ (placed above 4636, 7^- level) reported in (α,nγ),(^{11}B,2npγ) (1980Si02,1978Ne02).

@ Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ-ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

& Multiply placed with intensity suitably divided.

[a] Placement of transition in the level scheme is uncertain.
