This half-life can be compared with $T_{1/2}$>3.6×10^{23} y, obtained using NEMO detector with a larger ^{82}Se exposure of ≈3.5 kg y (2011Ba55). From the half-life limit, deduced effective Majorana neutrino mass of <(376-770) meV, depending on the nuclear matrix element calculations (2018Az05).
